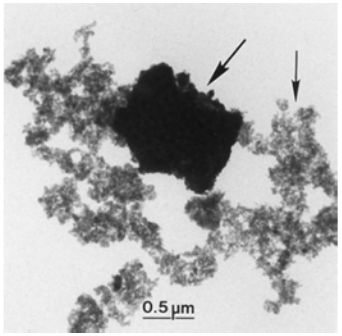
The link between air pollution particles and lung cancer: mechanistic considerations



Er luftforurensing en relevant årsak til lungekreft?

Jørn A Holme

Editorial, thelancet: 388, August 6, 2016:

Lung cancer: despite advances, prevention is still best

Worldwide:
No 1 - 1·8 million diagnosed – No 1 of all cancer deaths

Norway :
No 2 - 3080 diagnosed (~10%) – No 1 of all cancer deaths (~20%)

Three main types of lung cancer

Non-small cell lung cancer (NSCLC; 80% to 85%)
– several subtypes (Squamous cell carcinoma, adenocarcinoma, and large cell carcinoma)

Small cell lung cancer (SCLC; 10% to 15%)

Lung Carcinoid Tumors (5%)

Various main type often different prognoses and treatment

Risk factors includes

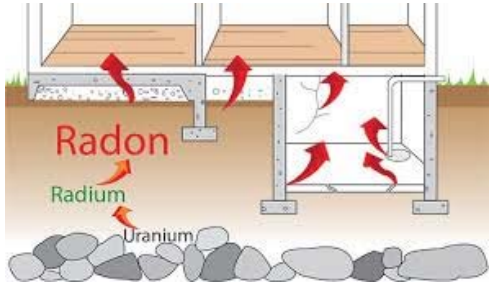
Genetic predisposition
Increased age
Environmental factors like cigarette smoke and air pollution – **preventable**

Male incidence rates stabilized/ Female still increasing:
Relative increases in adenocarcinomas and decreases in squamous-cell carcinoma

Environmental risk factor for lung cancer

Cigarette smoke (80%, complex mixture of chemical compounds bound to aerosol particles and/or are free in the gas phase)

Radon – bound to particles



Air pollution and diesel exhaust particles

complex mixture of various particular matter (PM) and gas

Workplace asbestos, or certain other chemicals

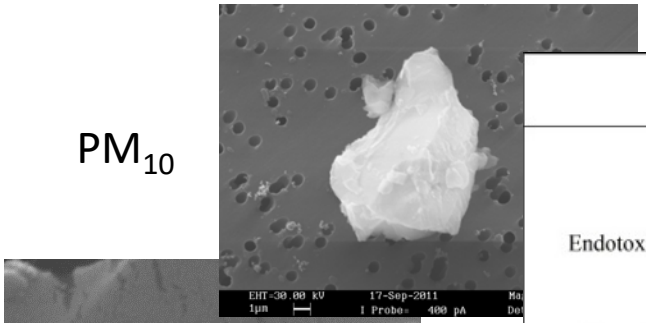
Airborne particular matter (PM)

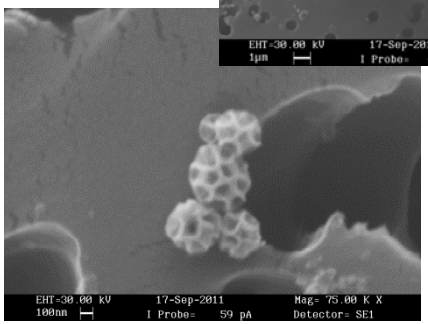
Ambient air PM composition is complex

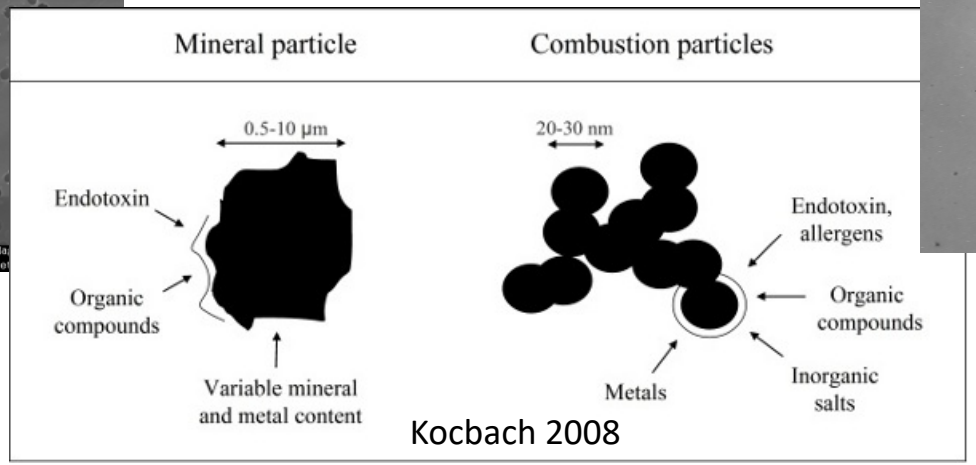
coarse (2.5-10 µm)
fine (<2.5 µm)
ultrafine (UFP <100 nm)

PM_{10} (coarse, fine and UFP)
$PM_{2.5}$ (fine and UFP)
UFP

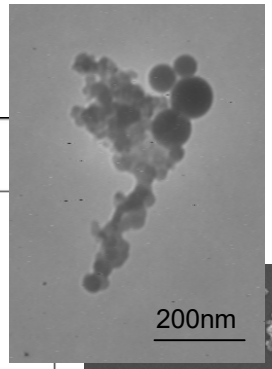
PM_{10}



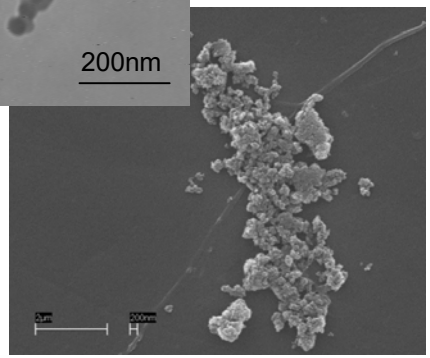




Kocbach 2008



$PM_{2.5}$



Sources:
- Fine and UFP: combustion processes (e.g. traffic, heating)
- Coarse: dust stirred up by vehicles on roads, biological

Deposition varies depending on size distribution and particle morphology

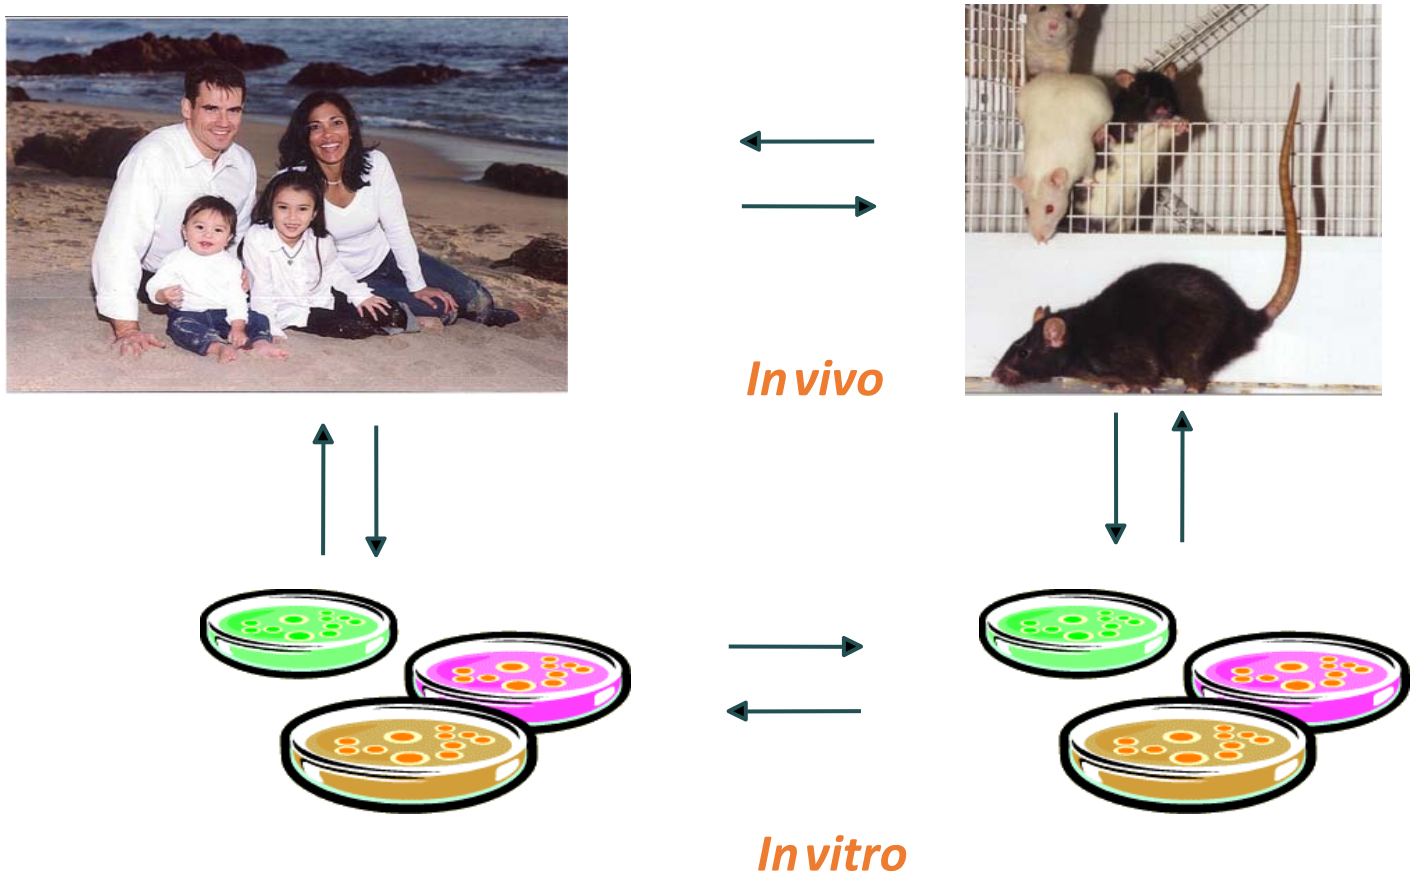
Outdoor air pollution and particular matter (PM):
cardiovascular diseases, chronic respiratory diseases and lung cancers

Sources:
road dust and combustion of diesel, wood, coal, biomass, and crude oil

Outdoor air pollution, outdoor air PM and diesel PM:
classified as carcinogenic to human beings by WHO – (IARC, SCI PUB NO. 161 - 2013)

IARC Group 1 carcinogen based on:

i) sufficient evidence of carcinogenicity in humans
ii) experimental animals
iii) strong mechanistic evidence



IARC, The Lancet, Oncology, 14, (13): 1262–1263, 2013

Air pollution and lung cancer incidence in 17 European cohorts: prospective analyses from the European Study of Cohorts for Air Pollution Effects (ESCAPE)

Hazard ratio (HR)

	Number of cohorts	HR (95% CI) for histological cancer subtype analysis		HR (95% CI) for standard analysis*	
		PM_{10}	$PM_{2.5}$	PM_{10}	$PM_{2.5}$
All participants					
All lung cancers	14†	1·22 (1·03–1·45)	1·18 (0·96–1·46)	1·22 (1·03–1·45)	1·18 (0·96–1·46)
Adenocarcinomas	11‡	1·51 (1·10–2·08)	1·55 (1·05–2·29)	1·22 (1·01–1·47)	1·16 (0·92–1·45)
Squamous-cell carcinomas	7§	0·84 (0·50–1·40)	1·46 (0·43–4·90)	1·19 (0·94–1·51)	1·18 (0·91–1·52)

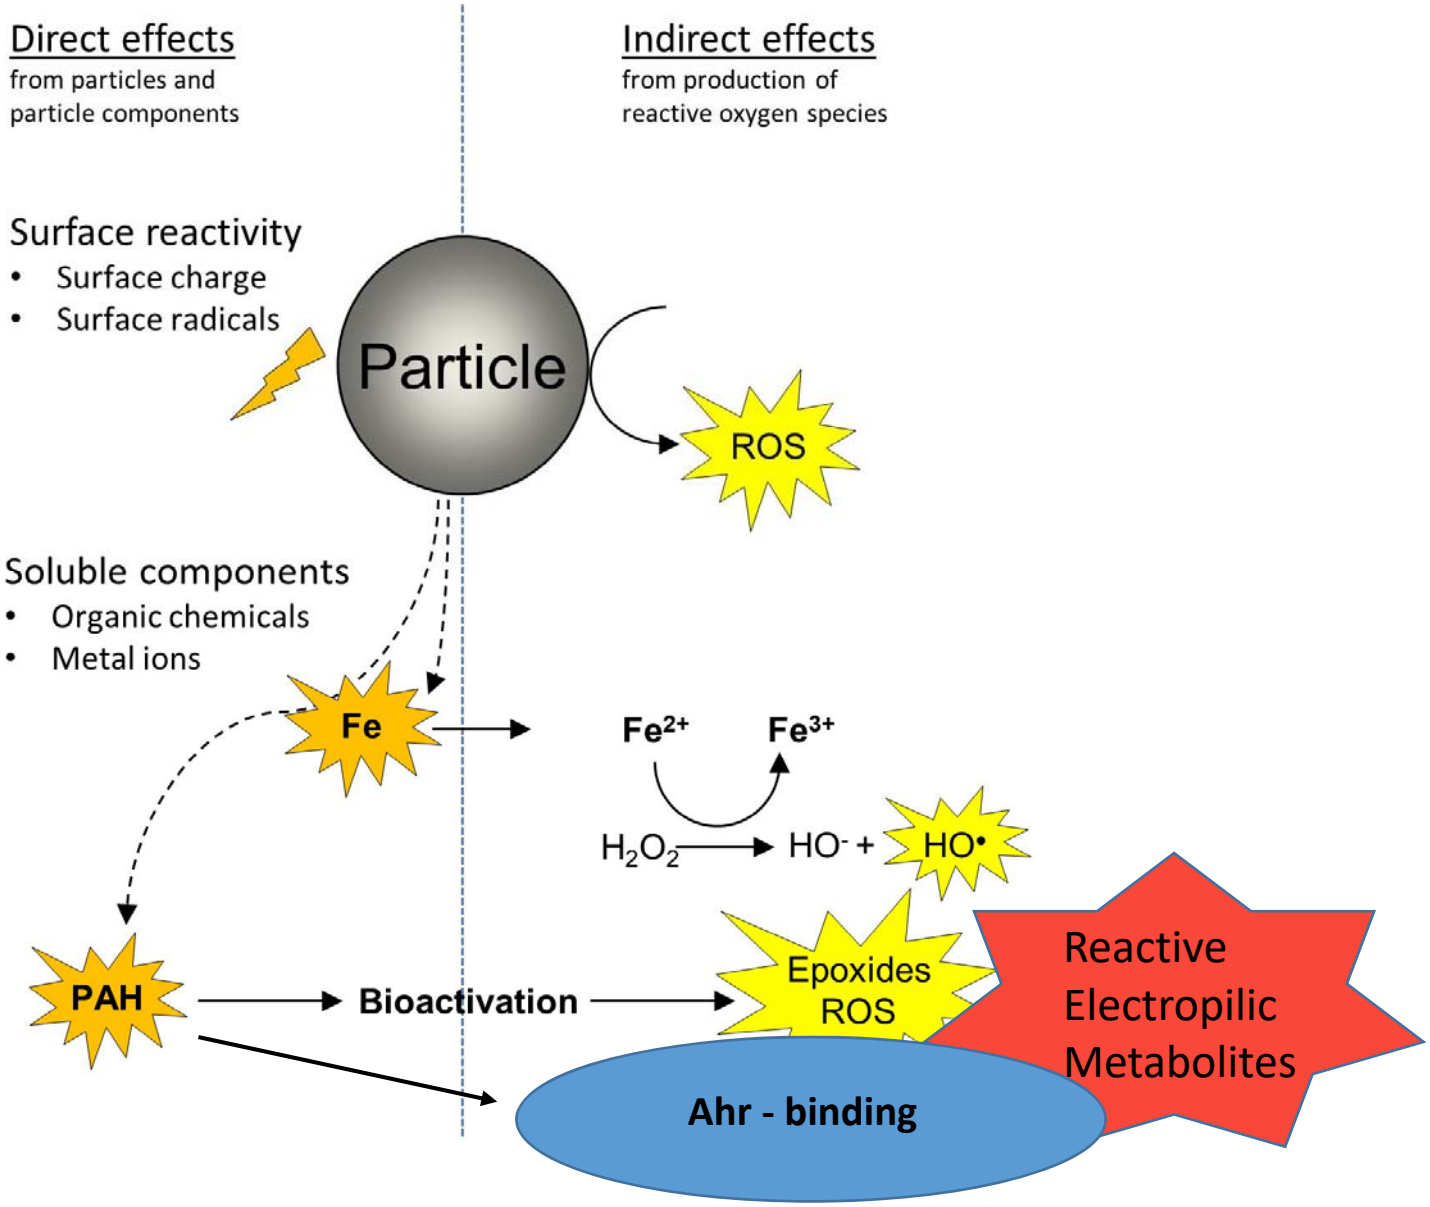
PM properties related to cancer

PM as such as well as chemicals adsorbed (polycyclic aromatic hydrocarbons): reactive electrophilic metabolites, oxygen species, receptor binding



Effects of PM linked to: cancer initiation, promotion and micro-environment

Binding to various cellular receptors / ROS/REM reacting with macromolecules

DNA damage /DDR - Mutation

- ssDNAbreaks/ adducts
- Gene mutation
- Chromosomal aberrations/ SCE/MN – genetic instability

Cell death (apoptosis and/ or necrosis) – resistance towards cell death

Cell cycle alteration

Metabolic reprogramming

- increased glycolysis and upregulation of amino acid and lipid metabolism

Cellular interactions:

- tight junction
- gap junction (GJIC)
- contact inhibition – proliferation

Cell migration and invasion

Inflammatory responses

Extracellular matrix (ECM)

Epithelial-to-mesenchymal transition (EMT)

Cell transformation

Epigenetic changes

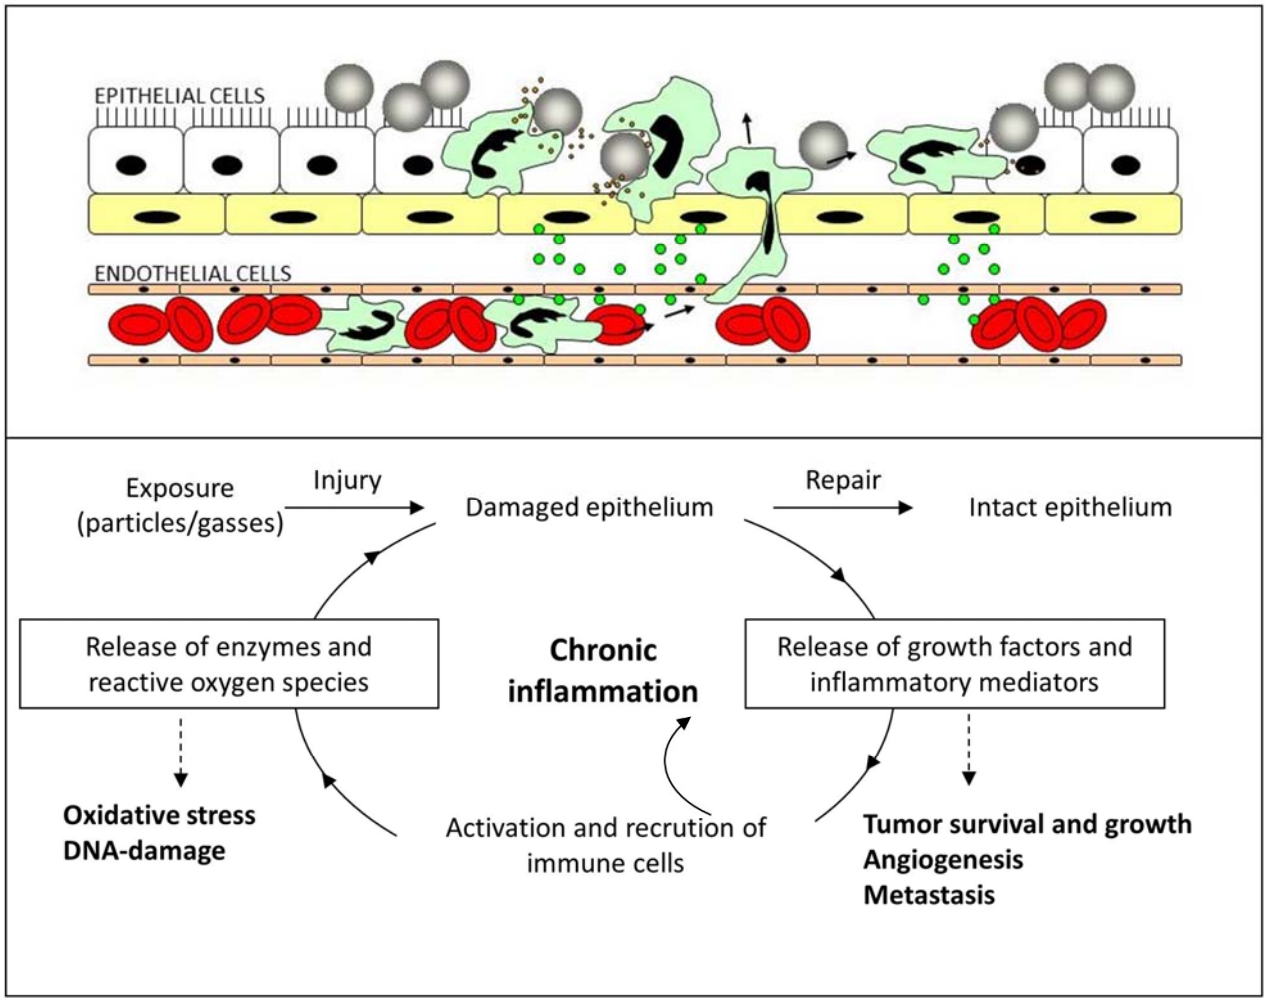
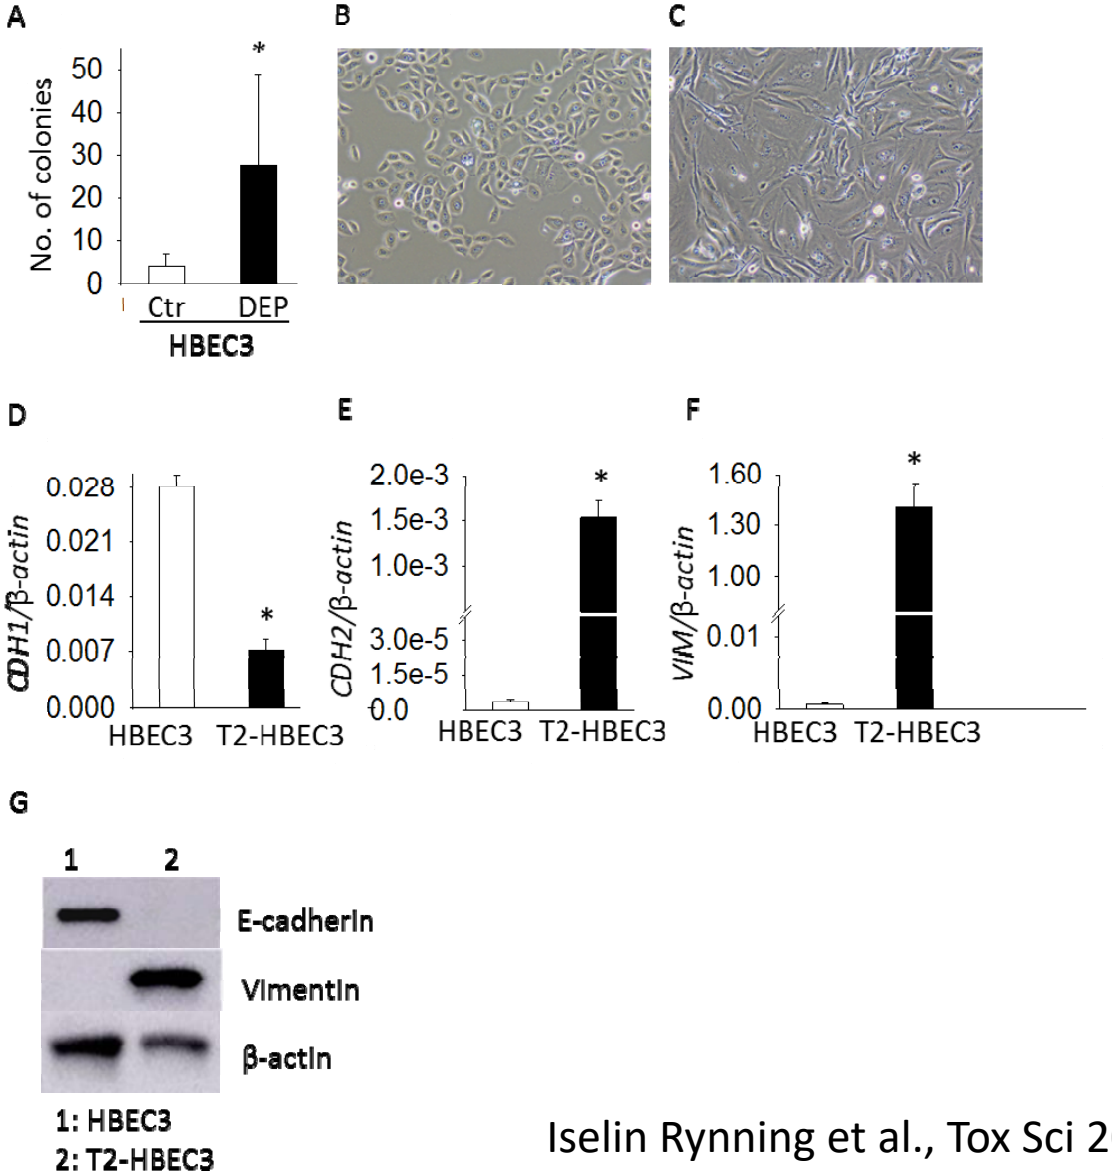
PM is linked to chronic inflammation: a milieu for cancer development



Adapted from Davies and Holgate 2002

Exposure of human bronchial epithelial cells (HBEC3) to DEP led to “cellular transformation”

DEP (NIST SRM2975) - transformed cells (T2-HBEC3): mesenchymal/fibroblast-like morphology, reduced CDH1 and enhanced CDH2 and VIM



Iselin Rynning et al., Tox Sci 2018, submitted

Deregulated genes between HBEC3 and T2-HBEC3 baseline

Gene expression profiling:
429 genes (224(↑) and (205↓)) were found to be significantly deregulated between HBEC3 and T2-HBEC3.

Genes were identified as being involved in regulation of cell migration and lung carcinogenesis:
DNER(↑), FBLN1(↑), HBEGF(↓), IGFBP3(↑), LAMA4(↑), PROS1(↑), RAB25(↓), SPOCK1(↑), ST14(↓), TGFBR3(↑), TP53INP1(↑), CD9(↓), CLDN1(↓), DUSP6(↓), EPCAM(↓), EPHA1(↓), FOXA2(↓), HAS3(↓), HTRA1(↑), MUC1(↑), PMEPA1(↑), TIMP2(↑), (EGR1(↓), EPHA1(↓), IL1B(↓), and VIM(↑).

Deregulated genes between HBEC3 and T2-HBEC3 after short term DEP exposure

Four pathways were commonly deregulated in both HBEC3 and T2-HBEC3 in the short-term DEP-exposure experiments: "Tryptophan metabolism", "Valine, leucine and isoleucine degradation", "Terpenoid backbone biosynthesis" and "Steroid biosynthesis". Three pathways were significantly deregulated in HBEC3, only: "Metabolism of xenobiotics by cytochrome p450", "Phagosome" and "Aldosterone-regulated sodium reabsorption". In T2-HBEC3, several pathways associated with inflammatory responses were identified in addition to "Synthesis and degradation of ketone bodies", "Butanoate metabolism" and "Pyruvate metabolism".

Differences between HBEC3 and T2-HBEC3 regarding *steady-state levels* and *DEP-induced changes* of particularly ***CYP1A1, IL-1β, PGE2 and PGF2α*** may have implications for acute inflammation and carcinogenesis.

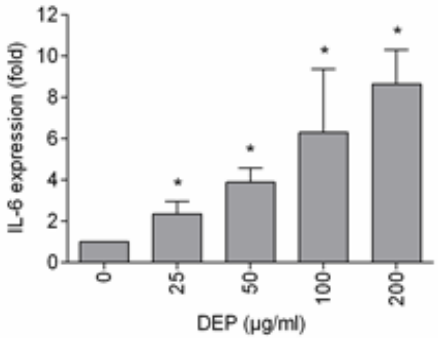
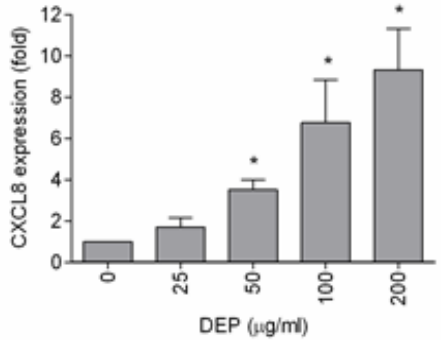
Inflammatory responses of DEP (MAPCEL soot) in BEAS-2B

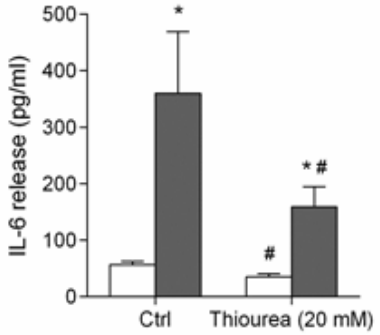


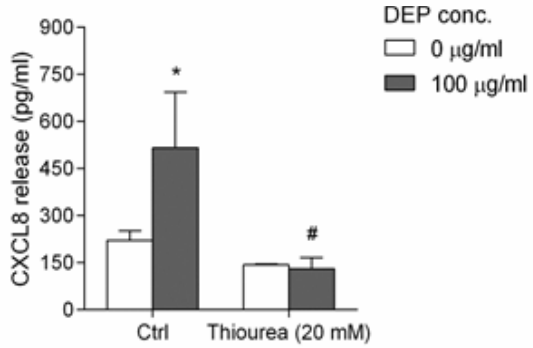


Increased expression and release:

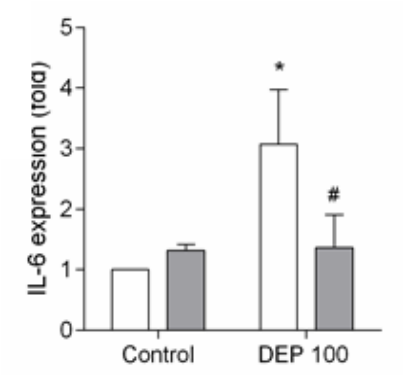
IL-6: pro-inflammatory cytokine

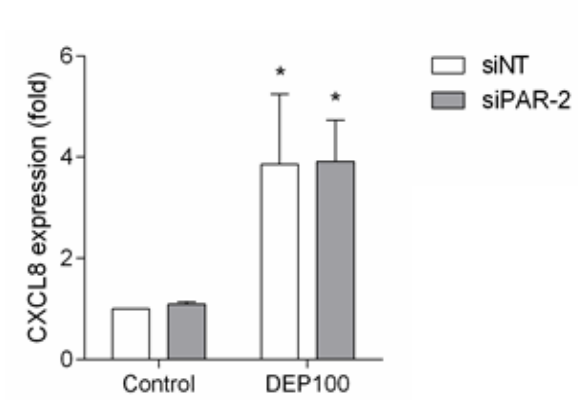
IL-8/CXCL8: chemokine





Role of ROS/ REM





DEP via PAR-2, regulate matrix metalloproteinase-1 (MMP-1) and calcium influx through TRPV4-channels (Lie et al, Environ. Health Perspect 2011)

Role of PAR-2
(protein activated receptor-2)

N Bach et al, Tox Lett 2015

Proinflammatory responses:
mainly due to extractable organic compounds
